

PANACAST 50 SERIES

# Whiteboard Explained

The PanaCast 50 has an integrated content camera that can live stream whiteboard content, so there's no need to buy and set up an extra external camera. Sharing a whiteboard isn't the only way to use this feature. For example, teachers could show a world map on the classroom wall, or doctors could display an X-ray board. Whatever content you want to spotlight, our built-in camera has you covered.

## PANACAST 50

### Whiteboard

The PanaCast 50 BYOD enables you to share a single video stream in real-time. This means you can share either whiteboard content or a view of the people in the meeting – but not both at the same time.

### Benefits:

- Enables virtual and physical attendees to share whiteboard content more equally for better collaboration and productivity.
- Removes the need to purchase a separate content camera.

### Availability:

- This feature works across online meeting platforms including Microsoft Teams and Zoom.
- PanaCast 50 has also been certified by Microsoft Teams as an integrated Content Camera.

Sharing a whiteboard using Microsoft Teams...

...and as seen by the remote participant

# PANACAST 50 ROOM SYSTEM

## Benefits:

- Removes the need to purchase a separate content camera.
- Enables virtual and physical attendees to view whiteboard content for better collaboration with a choice of single or dual video streams.
- If dual stream is enabled, virtual attendees can see the whiteboard and the room participants simultaneously on separate video streams for improved context of the meeting.

## Availability:

With Microsoft Teams Rooms-Windows (MTR-W) and Zoom Rooms, customers can choose to:

- Share single video streams (just the whiteboard)
- Share dual video streams (both the whiteboard and those present in the meeting room)

PanaCast 50 is also certified by Microsoft as an integrated Content Camera.

## Additional functionality is exclusively available for MTR-W:

- The transparency functionality minimizes the issue of the presenter physically blocking the whiteboard content by enabling the viewer to 'see through' the presenter to see the whiteboard content more clearly.
- The content enhancement functionality improves the visibility of the whiteboard by toning down glare from overhead lights or windows and enhancing the view if for example a faint marker is used on the board.
